

Gulf of Mexico Harmful Algal Bloom Bulletin

Region: Texas

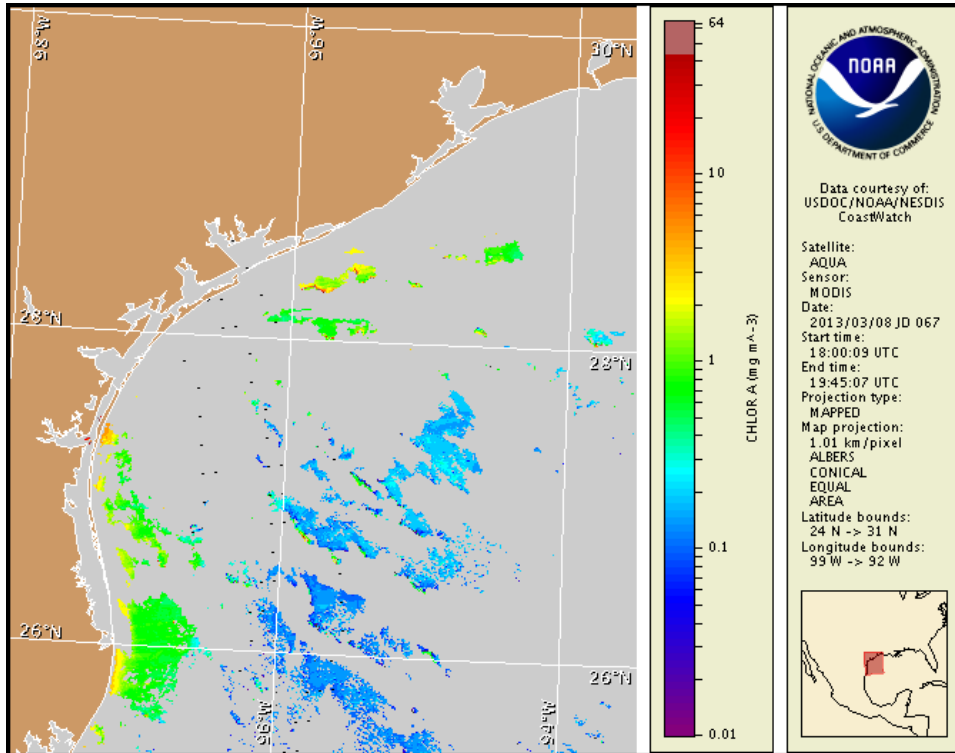

Monday, 11 March 2013

NOAA National Ocean Service

NOAA Satellite and Information Service

NOAA National Weather Service

Last bulletin: Monday, March 4, 2013

Satellite chlorophyll image with possible *K. brevis* HAB areas shown by red polygon(s). Cell concentration sampling data from March 1 to 8 shown as red (high), orange (medium), yellow (low b), brown (low a), blue (very low b), purple (very low a), pink (present), and green (not present). Cell count data are provided by Texas Parks and Wildlife Department. For a list of sample providers and a key to the cell concentration categories, please see the HAB-OFS bulletin guide:

http://tidesandcurrents.noaa.gov/hab/habfs_bulletin_guide.pdf

Detailed sample information can be obtained through the Texas Parks and Wildlife Department at:

Conditions Report

There is currently no indication of a harmful algal bloom of *Karenia brevis* (commonly known as Texas red tide) at the coast in Texas. No respiratory impacts are expected alongshore the Texas coast today through Monday, March 18. For information on area shellfish restrictions, contact the Texas Department of State Health Services.

Analysis

There is currently no indication of a harmful algal bloom of *Karenia brevis* at the coast in Texas. Recent MODIS imagery from 3/7-3/10 (MODIS, 3/8; shown left) has been obscured by clouds along- and offshore the Texas coast, preventing analysis. MODIS imagery from 3/6 (not shown) is partially obscured by clouds along the coast, limiting analysis. Patches of elevated to very high chlorophyll (2 to >20 $\mu\text{g/L}$) are visible along- and offshore from Sabine Pass to offshore the Matagorda Peninsula region, with elevated chlorophyll (2-8 $\mu\text{g/L}$) visible stretching along- and offshore from the Mustang Island region to south of the Rio Grande. Elevated chlorophyll is not indicative of the presence of *K. brevis* and is most likely an artifact of clouds in the imagery and the resuspension of benthic chlorophyll and sediments along the coast.

Forecast models based on predicted near-surface currents indicate a potential maximum transport of 40 km south from the Port Aransas region from March 8-14.

Davis, Kavanaugh

Wind speed and direction are averaged over 12 hours from buoy measurements. Length of line indicates speed; angle indicates direction. Red indicates that the wind direction favors upwelling near the coast. Values to the left of the dotted vertical line are measured values; values to the right are forecasts. Wind observation and forecast data provided by NOAA's National Weather Service (NWS).

Wind Analysis

Port Aransas: North winds (10-20kn, 5-10m/s) today becoming northeast winds (5-10kn, 3-5m/s) after midnight. East winds (5-15kn, 3-8m/s) Tuesday through Thursday afternoon. Southeast winds (10-15kn, 5-8m/s) Thursday night through Friday.

Satellite chlorophyll image and forecast winds for March 12, 2013 06Z with cell concentration sampling data from March 1 to 8 shown as red (high), orange (medium), yellow (low b), brown (low a), blue(very low b), purple (very low a), pink (present), and green (not present). Cell count data are provided by Texas Parks and Wildlife Department. For a list of sample providers and a key to the cell concentration categories, please see the HAB-OFS bulletin guide:

http://tidesandcurrents.noaa.gov/hab/habfs_bulletin_guide.pdf

Verified and suspected HAB areas shown in red. Other areas of high chlorophyll concentration shown in yellow (see p. 1 analysis for interpretation).
